NEDO human CDNA sequencing project supported by Ministry of

Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Biotechnology (RAB); cDNA library

construction: Helix Research Institute (HRI) (supported by Japan

Key Technology Center etc.); 5' = 3'-end one pass sequencing: RAB,

HRI, and Biotechnology Center etc.); 5' = 3'-end one pass sequencing: RAB,

HRI, and Biotechnology Center (PAB):

Evaluation; clone selection for full insert sequencing: HRI and

RAB; annotation: HRI and RAB.

141681 segs, 52070155 residues

Searched:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

SwissProt\_42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SIMILARITY: Belongs to the Ser/Thr family of protein kinases, CAMP
                                                                                                                                                                     Mann S.K.O., Yonemotor W.M., Taylor S.S., Firtel R.A.;

Mann S.K.O., Yonemoto W.M., Taylor S.S., Firtel R.A.;

"DdPK3, which plays essential roles during Dictyostelium development,
encodes the catalytic subunit of CAMP-dependent protein kinase.";

Proc. Natl. Acad. Sci. U.S.A. 89:10701-10705(1992).

-!- FUNCTION: Essential for differentiation and fruit morphogenesis.

-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

-!- CAMPITI IN DICTYOSTELIUM THE HOLORMIXTME IS A DIMER COMPOSED OF
A REGULATORY (R.) AND A CATALYTIC (C.) SUBUNIT. IN THE PRESENCE OF
CAMP IT DISSOCIATES INTO THE ACTIVE C SUBUNIT. AND AN R MONOWER.

-!- DEVELOPMENTAL STAGE: CAPK activity is low in vegetatively growing amobeae, increases during development of aggregation and reaches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             325 PPV---NARBRLKBFKQIRVLGTGTFGKVYLIQ--NTKDGCYYAMKCLNKAYVVQLKQVB

T "AtpKl, a novel ribosomal protein kinase gene from Arabidopsis. II.
T "AtpKl, a novel plochemical analysis of the encoded protein.";
J. Biol. Chem. 269:17593(1994).
I. Diol. Chem. 269:17593(1994).
I. Diol. Chem. 269:17593(1994).
I. DEVELOPMENTE. Phosphorylates two ribosomal proteins, Pl4 and Pl6.
I. TISSUE SPECIFICITY: Expressed in all tissues.
I. Graving buds, root tips, leaf margins and germinating seeds.
In growing buds, root tips, leaf margins and germinating seeds.
I. PTM. Undergoes serine-specific autophosphorylation.
I. PTM. LAMILARITY: Belongs to the Ser/Thr family of protein kinases. S6
Kinase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ATP (BY SIMILARITY).

RINZYME REGULATION: Activated by CAMP.

SUBUNIT: A number of inactive tertameric holoenzymes are produced by the combination of homo- or heterodimers of the different regulatory subunits associated with two catalytic subunits. CAMP causes the dissociation of the inactive holoenzyme into a dimer of regulatory subunits bound to four CAMP and two free monomeric catalytic subunits.

SUBCELLULAR LOCATION: Cytoplasmic (inactive holoenzyme and

-!- FUNCTION: Phosphorylates a large number of substrates in the cytoplasm and the nucleus.

-!- CATALYIC ACTIVITY: ATP 4 a protein = ADP + a phosphoprotein.

-!- CATALYIC ACTIVITY: ATP 4 a protein = ADP + a phosphoprotein.

-!- SUBUNIT: A number of inactive tetrameric holoenzymes are produced by the combination of homo- or heterodimers of the different regulatory subunits associated with two catalytic subunits. CAMP causes the dissociation of the inactive holoenzyme into a dimer of regulatory subunits bound to four CAMP and two free monomeric
                                                                                                                                                                                                                                                                   -1- SUBCELLUIAR LOCATION: Cytoplasmic (inactive holoenzyme and monomeric catalytic subunit). Translocates into the nucleus (monomeric catalytic subunit) (By similarity).
-1- TISSUE SPECIFICITY: Ubdquitously expressed in mammalian tissues.
-1- TISSUE SPECIFICITY: Ubdquitously of my and of the bander of the specific metal pammers.
-1- TISSUE SPECIFICITY: Ubdquitously langer nuclear/cytoplasmic ratio than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PHOSPHORYLATION (AUTO-) (BY SIMILARITY).

-!- FUNCTION: Protein kinase that is part of growth control pathway which is at least partially redundant with the cAMP pathway.

-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

-!- ENZYME REGILATION: Activated by CAMP.

-!- SIMILARITY: Belongs to the Ser/Thr family of protein kinases. CAMP.
                                                                                                       Johnston M., Andrews S., Brinkman R., Cooper J., Ding H., Dover J., Du Z., Favello A., Fulton L., Gattung S., Geisel C., Kirsten J., Kucaba T., Hillier L.W., Jier M., Johnston L., Langston Y., Latreille P., Louis E.J., Macri C., Mardis B., Menezes S., Mouser L., Nan M., Rifkin L., Riles L., St Peter H., Trevaskis E., Vaughan K., Vignati D., Milcox L., Mohldman P., Waterston R., Wilson R.,

-!- DISEABE: Defects in RPS6KA3 are the cause of Coffin-Lowry syndrome (CLS) [MIM:03600], an X-linked dominant disorder characterized by severe mental retardation with facial and digital dysmorphisms, and progressive skeletal deformations.
-!- SIMILARITY: Belongs to the Ser/Thr family of protein kinases. S6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 "Novel mutations in Rsk-2, the gene for Coffin-Lowry syndrome (CLS).";

    Bur. J. Hum. Genet. 7:20-26(1999).
    -1- FUNCTION: Phosphorylates a wide range of substrates including ribosomal protein S6. Implicated in the activation of the mitogenactivated kinase cascade.
    -1- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
    -1- TISSUR SPECIFICITY: Expressed in many tissues, highest levels in

--- TISSUB SPECIFICITY: Intestine, thymus, lung, heart and brain.
--- PTM: Autophosphorylated on Ser-386, as part of the activation process (By similarity).
--- SIMILARITY: Belongs to the Ser/Thr family of protein kinases. S6

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
